ON THE pH-BUFFERING EFFECTS OF THE $CO_2 - CO_3^{2-}$ SYSTEM IN DEEP GROUNDWATERS

B Allard

Department of Nuclear Chemistry Chalmers University of Technology Göteborg, Sweden 1982-12-10

This report concerns a study which was conducted for SKBF/KBS. The conclusions and viewpoints presented in the report are those of the author(s) and do not necessarily coincide with those of the client.

A list of other reports published in this series during 1982, is attached at the end of this report. Information on KBS technical reports from 1977-1978 (TR 121), 1979 (TR 79-28), 1980 (TR 80-26) and 1981 (TR 81-17) is available through SKBF/KBS.

ON THE pH-BUFFERING EFFECTS OF THE $CO_2 - CO_3^{2-}$ SYSTEM IN DEEP GROUNDWATERS

B. Allard

Department of Nuclear Chemistry Chalmers University of Technology S-412 96 Göteborg, Sweden 1982-12-10

SUMMARY

Equilibria in the system $H_2O-CO_2-CaCO_3(s)$ are discussed and data from some deep granitic groundwaters are summarized. For most waters pH would be in the range 7-9 and the total carbonate concentration in the range 30-400 mg/l (more often 90-275 mg/l). The observed field data represent reasonably well closed water systems with fixed total carbonate concentrations.

The carbonate concentration (CO_3^2) can be estimated from log $[CO_3^{2-}] = 0.76$ pH-10.83±0.08, which would represent about 50% of all the observed concentration/pH-data (for the waters with the highest carbonate concentrations). CONTENTS

1. CARBONATE EQUILIBRIA IN NATURAL WATERS

In this study the system $H_2O-CO_2-CaCO_3(s)$ is briefly described in order to illustrate how pH is affected by reactions in this system and to define what pH and carbonate concentrations would be expected in deep granitic groundwaters.

The carbonate system has been thoroughly described in the literature. The subsequent discussion and calculated cases are largely taken from ref. $\underline{1}$ and $\underline{2}$.

1.1. <u>Reactions and thermodynamic constants</u>

The presence of carbonate due to equilibria in the system CO_2 - H_2CO_3 - $HCO_3^{-}-CO_3^{2-}$ and the precipitation of $CaCO_3(s)$ are the major pH-buffering mechanisms in most natural waters. The following reactions are of importance:

$$CO_2 + aq = CO_2(aq)$$
 (1)
H₂O + CO₂(aq) = H₂CO₂ (2)

$$\begin{array}{c} H_{2}CO_{3} = H^{+} + HCO_{3}^{2} \\ HCO_{3}^{-} = H^{+} + CO_{3}^{2} \\ HCO_{3}^{-} = H^{+} + CO_{3}^{2} \\ \end{array}$$
(3)

$$Ca^{2+} + HCO_{3}^{-} = CaHCO_{3}^{+}$$
(5)

$$Ca^{2+} + CO_{3}^{2-} = CaCO_{3}$$
(6)

$$Ca^{2+} + CO_{3}^{2-} = CaCO_{3}(s)$$
(7)

By combining reaction (1) and (2) and neglecting (5) and (6), the following equations will be obtained, defining the CO_3^{2} -system in most natural waters:

$$[H_2CO_3]/P(CO_2) = K'$$
(8)

$$[H_{+}][CO_{32}]/[H_{2}CO_{3}] = K_{1}$$
(9)

$$[H_{+}^{+}][CO_{3}^{2}] / [HCO_{3}^{-}] = K_{2}$$
(10)

$$\begin{bmatrix} H^{\mathsf{T}} \end{bmatrix} \begin{bmatrix} 0H^{\mathsf{T}} \end{bmatrix} = K_{\mathsf{W}} \tag{11}$$

$$[Ca^{2^{+}}][CO_{3}^{2^{-}}] = K_{s}$$
(12)

Values of the constants are given in Table 1.

. 1

	$I = 0, 25^{\circ}C$	$I = 4 \times 10^{-3}, 10^{\circ} C$

log K _s	-8.42	-7.95		

Table 1 Stability constants in the carbonate system

1.2. The carbonate system in granitic groundwaters

1.2.1. Total carbonate concentrations

The following concentrations of CO_2 and total CO_3^{2-} would be expected in nature (typical ranges):

Air	$(2.9-3.3)\times 10^{-4}$	atm
Rain water	0.6-3 mg/1	
Surface water	6-300 mg/1	
Groundwaters	30-485 mg/1	

In granitic groundwaters the total carbonate is usually in the concentration range 60-250 mg/ml. In a few cases concentrations as low as 20 mg/l, and up to 400 mg/l have been found (3-6).

In the subsequent calculations the following total carbonate concentrations (C_T) have been assumed as possible minimum and maximum concentrations in granitic groundwaters:

 $(C_T)_{min} = 19 \text{ mg/l} (= 10^{-3.5} \text{ M})$ $(C_T)_{max} = 485 \text{ mg/l} (= 10^{-2.1} \text{ M})$

1.2.2 Total calcium concentrations

Usually the calcium concentration is between 5 and 50 mg/l,

and seldom above 100 mg/l, in granitic groundwaters. In a few cases, however, very high calcium concentrations (over 1000 mg/l; ca 1800 mg/l in one case), far above the calcium concentration in sea water (ca 390 mg/l) have been observed.

In the subsequent analysis, the following calcium concentrations (C_M) will be used, representing likely minimum and maximum levels:

$$(C_{M})_{min} = 5.0 \text{ mg/l} (= 10^{-3.9} \text{ M})$$

 $(C_{M})_{max} = 400 \text{ mg/l} (= 10^{-2.0} \text{ M})$

1.2.3 pH-range

For most deep groundwaters pH would be in the interval 7.2-8.5, and seldom below 7 or above 9. In a few cases, however, pH as low as 6.3 has been recorded, as well as above 10 in others.

The following minimum and maximum pH-values are probable:

pH_{min} = 6.0 pH_{max} = 10.5

2. CALCULATED pH- AND CONCENTRATION RANGES

The pH that would be obtained by dissolution of $CaCO_3(s)$ is calculated and discussed below for some cases of environmental interest.

2.1 <u>Dissolution of CaCO₃(s) in pure water</u>

No initial CO_2 -pressure is assumed, and the gas phase after equilibrium is negligible. Thus, pH, $[Ca^{2+}]$ and total $[CO_3^{2-}]$ are entirely determined by the dissolution of $CaCO_3(s)$.

This case will simply be characterized by eqn (9-12) and the mass balances

$$\begin{bmatrix} Ca^{2+} \end{bmatrix} = \begin{bmatrix} CO_3^{2-} \end{bmatrix} + \begin{bmatrix} HCO_3^{-} \end{bmatrix} + \begin{bmatrix} H_2CO_3 \end{bmatrix}$$

2[Ca²⁺] + [H⁺] = 2[CO₃²⁻] + [HCO₃⁻] + [OH⁻]

The following equilibrium concentrations are obtained at I = 0, $25^{\circ}C$ (c.f. Table 1):

$$\begin{bmatrix} Ca^{2+} \end{bmatrix} = 10^{-3.9} \quad (5.1 \text{ mg/l}) \\ \begin{bmatrix} HC0_3^{-} \end{bmatrix} = 10^{-4.05} \\ \begin{bmatrix} C0_3^{2-} \end{bmatrix} = 10^{-4.4} \quad (C_T = 7.8 \text{ mg/l}) \\ pH = 9.9 \end{bmatrix}$$

This system is normally not representative of conditions in natural groundwaters.

2.2 <u>Dissolution of $CaCO_3(s)$ in water with a constant external</u> <u> CO_2 -pressure</u>

An external constant CO_2 -pressure is assumed, e.g. $P(CO_2) = 10^{-3.5}$ atm (equilibrium with the atmosphere).

This case is characterized by eqn (9-12) and the mass balance

$$2[Ca^{2+}] + [H^{+}] = 2[CO_3^{2-}] + [HCO_3^{-}] + [OH^{-}]$$

The following equilibrium concentrations are obtained at I = 0, $25^{\circ}C$:

$$\begin{bmatrix} Ca^{2+} \end{bmatrix} = 10^{-3.4} \quad (16.0 \text{ mg/l}) \\ \begin{bmatrix} HCO_3^{-} \end{bmatrix} = 10^{-3.0} \\ \begin{bmatrix} CO_3^{23} \end{bmatrix} = 10^{-4.9} \quad (C_T = 61.8 \text{ mg/l}) \\ pH = 8.4 \end{bmatrix}$$

This system is representative of an aqueous system open to the atmosphere and saturated with respect to $CaCO_3(s)$.

This case is representative of a closed groundwater system, where total carbonate and pH are given. Saturation with respect to $CaCO_3(s)$ is assumed.

The system is characterized by eqn (9-12) and the mass balances

$$[H_2CO_3] + [HCO_3^-] + [CO_3^2^-] = const. (analysis)$$

 $[H^+] = 10^{-pH} (analysis)$

This would be the most common case encountered in natural systems. The system is illustrated in Figure 1.

2.4 <u>Dissolution of CaCO₃(s) in a closed water system with</u> equal total carbonate and calcium concentrations

This case essentially illustrates the solubility of $CaCO_3(s)$ in a closed system of various pH.

The system is characterized by eqn (9-12) and the mass balances

$$[Ca^{2+}] = [CO_3^{2-}] + [HCO_3^{-}] + [H_2CO_3^{-}]$$

 $[H^+] = 10^{-pH}$ (analysis)

and is illustrated in Figure 2.

2.5. <u>Dissolution of CaCO₃(s) in a closed system with a CO₂</u> reservoir

This case illustrates the dissolution of $CaCO_3(s)^{+}$ either in a closed system with a reservoir of constant $P(CO_2)$ or a system that becomes separated from such a reservoir, Figure 3.

Figure 1 Dissolution of $CaCO_3(s)$ in a closed water system with a fixed total carbonate concentration. (a) I=0, 25°C, (b) I=4x10⁻³, 10°C. 1: $(C_M)_{max}$, 2: $(C_T)_{max}$, 3: $(C_T)_{min}$, 4: $(C_M)_{min}$

1: $(C_M)_{max}$, 2: $(C_T)_{max}$, 3: $(C_T)_{min}$, 4: $(C_M)_{min}$ Shaded areas indicate possible pH-ranges at equilibrium.

<u>Figure 2</u> Dissolution of $CaCO_3(s)$ in a closed water system with equal total carbonate and calcium concentrations. (a) I=0, 25°C, (b) I=4x10⁻³, 10°C. 1: $(C_M)_{max}$, 2: $(C_T)_{max}$, 3: $(C_T)_{min}$, 4: $(C_M)_{min}$. Thick lines indicate possible pH-ranges at equilibrium.

- Figure 3 Dissolution of $CaCO_3(s)$ in systems with a reservoir of co₂.
 - Solid lines: Constant P(CO₂).

- Dashed lines: System with enclosed CO_2 . (a) I=0, 25°C, (b) I=4×10⁻³, 10°C. 1: P(CO₂)=10⁻¹, 2: P(CO₂)=10⁻², 3: P(CO₂)=10⁻³ (atm) Shaded area indicates possible pH-ranges at equilibrium.

The $CaCO_3(s)$ equilibrium line in Figure 3 corresponds to

$$\log [HCO_3^{-}] = 0.5(\log K_2 - \log K_2 - 2pH)$$
 (13)

generated from eqn (9-12).

3. OBSERVED pH- AND CONCENTRATION RANGES

The calculated pH-ranges in $CaCO_3$ -saturated waters according to 2.1-2.5 above are summarized in Table 2, assuming $[Ca^{2+}]$ and total $[CO_3^{2-}]$ -ranges as given in 1.2.

Table 2 Calcuated pH-values in CaCO₃(s)-saturated water systems

System	рН	
(Pure water	9.9)	
Open system, $P(CO_2)=10^{-3.5}$ atm	8.4	
Closed system, constant C _T	6.3 - 9.9	
Closed system, C _T = C _M	6.4 - 9.3	
Closed system with CO ₂ reservoir	6.4 - 9.7	

In Figure 4 measured pH and HCO₃-concentration data are given for granitic groundwaters (from Finnsjön, Kråkemåla, Sternö, Svartboberget, Gideå, Fjällveden) (2-5) (C.f. Figure 1 and 3).

4. DISCUSSION AND CONCLUSIONS

From the observed field data and the calculated data for $CaCO_3(s)$ -saturated systems the following observations can be made:

- Most of the groundwaters are near saturation with respect to CaCO₃(s); many systems appear to be over-saturated.
- The H₂O-CO₂-CaCO₃-system buffers pH to the range 6.5-10, where a high pH would correspond to a low total carbonate concentration and often also a low calcium concentration; a low pH would correspond to high carbonate and calcium concentrations.

<u>Figure 4</u> Measured pH and HCO_3^- -concentrations.

(a) Closed system with fixed total carbonate concentration (=Figure 1), (b) System with a CO_2 reservoir (=Figure 3). The enclosed areas are the same as in Figure 1 and 3 (representing saturated systems)

- o The observed field data on pH and carbonate concentrations correspond reasonably well with the "closed system - fixed total carbonate concentration"-case. However, no effort is made to fully consider the variation of the stability constants with the ionic strength in the construction of Fig. 1 - 4.
- For most of the deep groundwaters studied the observed pH is in the range 7-9 and the observed total carbonate concentration in the range 30-400 mg/1, 0.5-6.5 mM; (more often in the range 90-275 mg/1, 1.5-4.5 mM).

Calculated ${\rm CO}_3^{2-}$ -concentrations are given in Fig. 5. For waters with high total carbonate concentrations (more than 90 mg/l), the ${\rm CO}_3^{2-}$ -concentration can be estimated from

$$\log \left[CO_3^{2-} \right] = 0.76 \text{pH} - 10.83 \pm 0.08$$

A lower limit is set by

$$\log [C0_3^{2-}] = pH-14.$$

<u>Figure 5</u> Calculated CO_3^{2-} -concentrations.

1. 400 mg/1 HCO₃; 2. 20 mg/1 HCO₃; 3. 90 mg/1 HCO₃.

- (a) log $[CO_3^{2-}] = 2pH-18.1+logP(CO_2), logP(CO_2) = -3.5$ Open system without CaCO₃(s).
- (b) $\log [CO_3^{2-}] = -4.9$, pH = 8.4 Dissolution of $CaCO_3(s)$ in an open system.
- (c) $\log [CO_3^{2-}] = 0.5 \text{pH-9.35}$ Dissolution of $CaCO_3(s)$ in a closed system with equal total carbonate and calcium concentration.
- (d) $\log [CO_3^{2-}] = -4.4$, pH = 9.9 Dissolution of $CaCO_3(s)$ in water.
- (e) $\log \left[CO_3^{2-}\right] = 0.76 \text{pH}-10.76$ Equal to or higher than 95% of measured data.
- (f) $\log [CO_3^{2-}] = 0.76 \text{pH}-10.83$ Equal to or higher than 75% of measured data.
- (g) log $[CO_3^{2-}] = 0.76 \text{pH}-10.91$ Equal to or higher than 50% of measured data.
- (h) $\log \left[CO_3^{2^-}\right] = 0.76 \text{pH-}11.16$ Equal to or higher than 25% of measured data.

(i)
$$\log [CO_3^{2-}] = pH-14$$

Approximate minimum level.

1979

TR 79-28 The KBS Annual Report 1979. KBS Technical Reports 79-01--79-27. Summaries. Stockholm, March 1980.

1980

TR 80-26 The KBS Annual Report 1980. KBS Technical Reports 80-01--80-25. Summaries. Stockholm, March 1981.

1981

TR 81-17 The KBS Annual Report 1981. KBS Technical Reports 81-01--81-16 Summaries. Stockholm, April 1982.

- TR 82-01 Hydrothermal conditions around a radioactive waste repository Part 3 - Numerical solutions for anisotropy Roger Thunvik Royal Institute of Technology, Stockholm, Sweden Carol Braester Institute of Technology, Haifa, Israel December 1981
- TR 82-02 Radiolysis of groundwater from HLW stored in copper canisters Hilbert Christensen Erling Bjergbakke Studsvik Energiteknik AB, 1982-06-29

- TR 82-03 Migration of radionuclides in fissured rock: Some calculated results obtained from a model based on the concept of stratified flow and matrix diffusion Ivars Neretnieks Royal Institute of Technology Department of Chemical Engineering Stockholm, Sweden, October 1981
- TR 82-04 Radionuclide chain migration in fissured rock -The influence of matrix diffusion Anders Rasmuson * Akke Bengtsson ** Bertil Grundfelt ** Ivars Neretnieks * April, 1982
 - Royal Institute of Technology Department of Chemical Engineering Stockholm, Sweden
 - ** KEMAKTA Consultant Company Stockholm, Sweden
- TR 82-05 Migration of radionuclides in fissured rock -Results obtained from a model based on the concepts of hydrodynamic dispersion and matrix diffusion Anders Rasmuson Ivars Neretnieks Royal Institute of Technology Department of Chemical Engineering Stockholm, Sweden, May 1982
- TR 82-06 Numerical simulation of double packer tests Calculation of rock permeability Carol Braester Israel Institute of Technology, Haifa, Israel Roger Thunvik Royal Institute of Technology Stockholm, Sweden, June 1982
- TR 82-07 Copper/bentonite interaction Roland Pusch Division Soil Mechanics, University of Luleå Luleå, Sweden, 1982-06-30
- TR 82-08 Diffusion in the matrix of granitic rock Field test in the Stripa mine Part 1 Lars Birgersson Ivars Neretnieks Royal Institute of Technology Department of Chemical Engineering Stockholm, Sweden, July 1982

- TR 82-09:1 Radioactive waste management plan PLAN 82 Part 1 General Stockholm, June 1982
- TR 82-09:2 Radioactive waste management plan PLAN 82 Part 2 Facilities and costs Stockholm, June 1982
- TR 82-10 The hydraulic properties of fracture zones and tracer tests with non-reactive elements in Studsvik Carl-Erik Klockars Ove Persson Geological Survey of Sweden, Uppsala Ove Landström Studsvik Energiteknik, Nyköping Sweden, April 1982
- TR 82-11 Radiation levels and absorbed doses around copper canisters containing spent LWR fuel Klas Lundgren ASEA-ATOM, Västerås, Sweden 1982-08-11
- TR 82-12 Diffusion in crystalline rocks of some sorbing and nonsorbing species Kristina Skagius Ivars Neretnieks Royal Institute of Technology Department of Chemical Engineering Stockholm, Sweden, 1982-03-01
- TR 82-13 Variation in radioactivity, uranium and radium-226 contents in three radioactive springs and along their out-flows, northern Sweden John Ek Sverker Evans Lennart Ljungqvist Studsvik Energiteknik AB Nyköping, Sweden, 1982-06-03
- TR 82-14 Oral intake of radionuclides in the population A review of biological factors of relevance for assessment of absorbed dose at long term waste storage Lennart Johansson National Defense Research Institute, Dept 4 Umeå, Sweden, October 1982
- TR 82-15 Radioactive disequilibria in mineralised drill core samples from the Björklund uranium occurrence, northern Sweden J A T Smellie Geological Survey of Sweden Luleå, December 1982
- TR 82-16 The movement of a redox front downstream from a repository for nuclear waste Ivars Neretnieks Royal Institute of Technology Stockholm, Sweden, 1982-04-19

- TR 82-17 Diffusion of hydrogen, hydrogen sulfide and large molecular weight anions in bentonite Trygve E Eriksen Department of Nuclear Chemistry Royal Institute of Technology, Stockholm Arvid Jacobsson Division of Soil Mechanics University of Luleå Sweden, 1982-07-02
- TR 82-18 Radiolysis of ground water from spent fuel Hilbert Christensen Erling Bjergbakke Studsvik Energiteknik AB Nyköping, Sweden, 1982-11-27
- TR 82-19 Corrosion of steel in concrete Carolyn M Preece Korrosionscentralen Glostrup, Denmark, 1982-10-14
- TR 82-20 Fissure fillings from Finnsjön and Studsvik, Sweden Identification, chemistry and dating Eva-Lena Tullborg Sven Åke Larson Swedish Geological, Gothenburg December 1982
- TR 82-21 Sorption of actinides in granitic rock B Allard Department of Nuclear Chemistry Chalmers University of Technology Göteborg, Sweden 1982-11-20
- TR 82-22 Natural levels of uranium and radium in four potential areas for the final storage of spent nuclear fuel Sverker Evans Svante Lampe Björn Sundblad Studsvik Energiteknik AB Nyköping, Sweden, 1982-12-21
- TR 82-23 Analysis of groundwater from deep boreholes in Kråkemåla, Sternö and Finnsjön Sif Laurent IVL Stockholm, Sweden 1982-12-22

TR 82-24 Migration model for the near field Final report Göran Andersson Anders Rasmuson Ivars Neretnieks Royal Institute of Technology Department of Chemical Engineering Stockholm, Sweden 1982-11-01 TR 82-25 On the pH-buffering effects of the CO₂-CO₃²⁻system in deep groundwaters B Allard Department of Nuclear Chemistry Chalmers University of Technology Göteborg, Sweden 1982-12-10
